

UNIVERSALLY APPLICABLE. THE KRONE FOLDING DOOR BOX BODY.

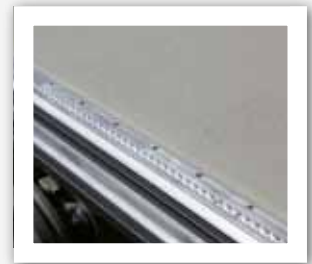

MULTI-FUNCTIONAL APPLICATION AND SIDE OPENING - THESE ARE THE TWO CHARACTERISTICS OF THE KRONE FOLDING DOOR BOX BODY, WHICH IS THUS IDEALLY SUITED FOR RAPID LOADING FROM THE SIDE.

One side wall of the box body is made of fixed sandwich panels, while the other one is composed of a total of 2 folding doors, each having 5 elements, so that this side of the box body can be opened almost fully. Also perfectly suited for transporting long load items. This means that the utilisation of the vehicle is improved and empty running is avoided. The FRC certification means that the folding wall

box body can also be used for cross-border food transport without limitations. As for all Cool Liners, KRONE, of course, relies on a continuous chassis for the folding door box body.

FRC-certified!

Rapid loading/unloading.

Two folding doors, each having 5 elements, open the side of the box body and feature a loading-through width of 11,830 mm. Strapping rails incorporated in the side wall and in the folding doors provide universal load securing in the folding door box body. Doubledeck, Multitemp and Vario-Lock equipment is also available.

Strapping belt rail.

Aluminium profiles integrated into the floor for stepless load securing using special strapping belts.

Space-saving evaporator mounting.

More internal height despite using a second evaporator: possible because of a recess in the roof.

Solid door stops.

Stainless steel door stops hold the open side doors safely in position.

Simple handling.

The folding door side opens in the middle. Due to sophisticated bearings, the folding doors can be easily opened and closed to the front or to the rear.

Sturdy rear.

Best suited for rough day-to-day docking jobs: The sturdy rear absorbs many shocks.
